

1. Prepare the area where you will place the mat

- Select a hard, flat, dry, smooth, and clean surface. Mats should be room temperature before installing, as cold temperatures will affect adhesive properties.
- Clean the placement area, removing any residue and dirt from the placement area. We recommend using 70% isopropyl alcohol and a heavy-duty, low-lint wipe or cloth to remove any previously existing adhesive or grime.

2. Test the mat placement

- Do not remove any film layers before testing the placement of the mat.
- Identify the top and bottom of the mat. The blue tab indicates the adhesive backing layer (face down). The top layer is blank, with numbers underneath the corner (face up).
- Align the mat so that the longest side is at a 90° angle to the door. This placement ensures three full steps for maximum dirt removal and prevents mat pull-ups.
- Make sure the mat does not interfere with any opening or closing doors. Ensure that the numbered pull tabs are easily accessible.

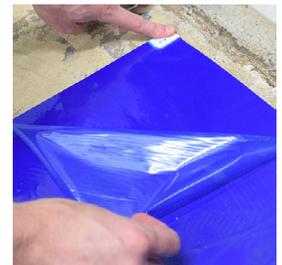

3. Install the mat

- Do not remove the top layer (yet). Starting with the blue tab, peel off the backing to expose 2"-3" of the adhesive.
- Adhere the edge with the exposed adhesive to the floor, taking care to avoid air bubbles.
- Once you've ensured that the adhered edge is flat and straight, slowly press the rest of the mat to the floor, working from the front edge toward the back. Use your hand, or an empty cardboard tube to press and remove any air bubbles.
- Once placed, ensure that the mat is firmly affixed, and smooth out any air bubbles.

4. Remove the top layer

- Starting from the numbered corner, remove the top protective layer. Peel slowly with consistent tension.
- When the top layer becomes soiled, remove it to expose the next layer as needed.
- For soiled layers, peel sides and corners toward the center to prevent debris or grit from contacting clean surfaces.

Important notice about storage

- Do not store these mats on their sides. Improper storage will result in wrinkles or creases.
